SUMMARY

Broadly interested in the theory and applications of scalable Bayesian inference methods for biological systems with large parameter spaces. Here are a couple of biological applications I work on:

- Using statistical inference to probe structural properties of plastic neural microcircuits, either in-silico or in-vivo, using calcium imaging data.
- Cytokine-induced transcriptional memory

This involves a broad range of theoretical tools derived from physics, information theory, stochastic processes, and Bayesian statistics.

I also have a general interest in high throughput tissue imaging for high-content screens of the tumor microenvironment during cancer immunotherapy
