

Visualizing chromatin organization with single molecule localization microscopy

Clayton W. Seitz

November 22, 2023

Outline

Single molecule localization microscopy

The time resolution of *d*STORM

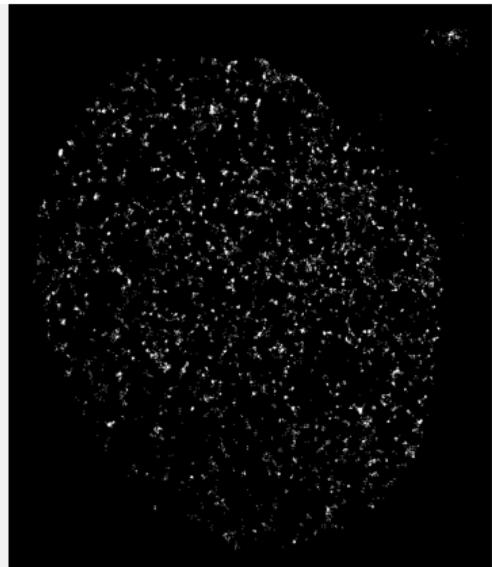

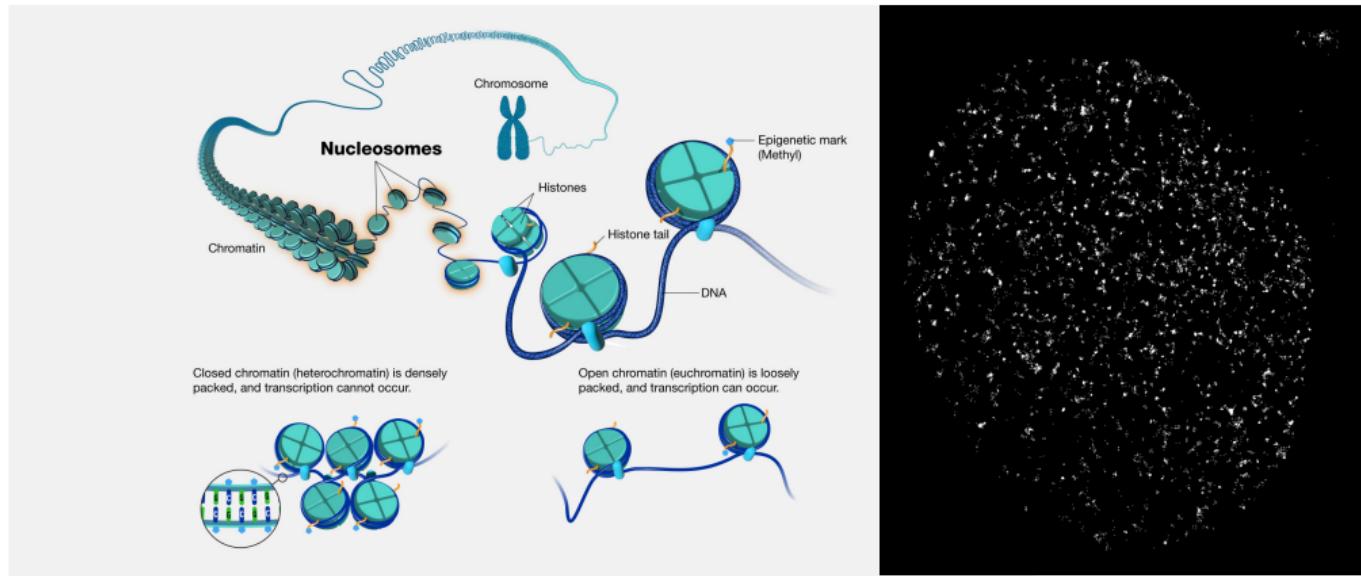

A novel approach to dense localization microscopy

Dense localization by fluorescence antibunching

Phase separation of chromatin

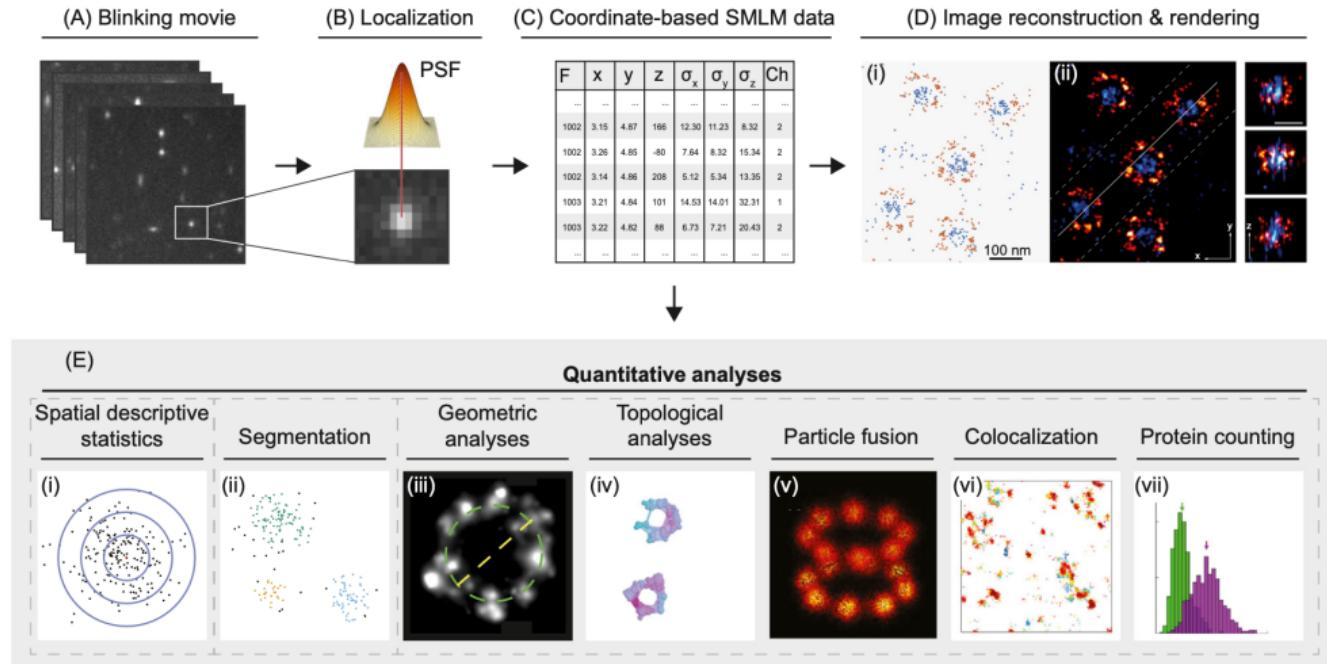

Single molecule localization microscopy

Genome organization and super resolution imaging

- ▶ Genome has a hierarchical structure, fundamental unit is the nucleosome
- ▶ We study chromatin organization by localizing fluorescently tagged nucleosomes

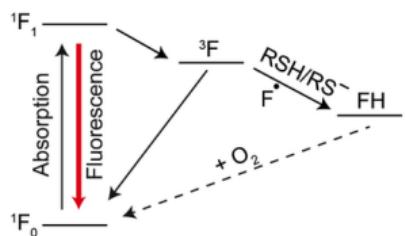

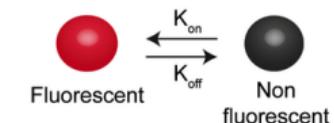

Single molecule localization microscopy

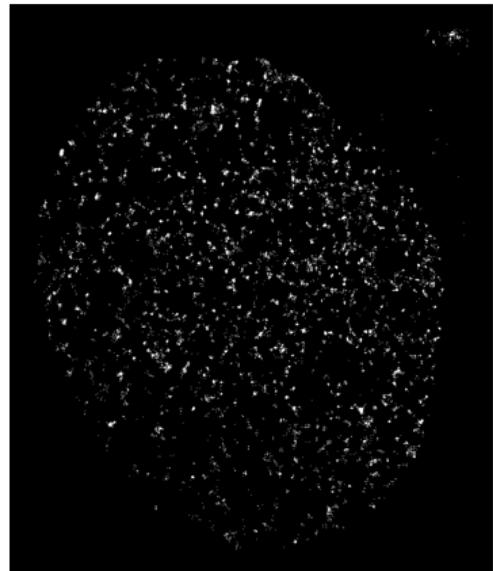

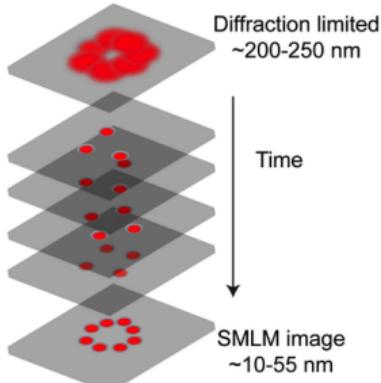

- Chromatin structure is dynamic and undergoes **phase separation** → We are pushing the limits of SMLM for time-resolution

Single molecule localization microscopy

a Photoswitching

b Temporal separation

- ▶ SMLM techniques are diffraction-unlimited
- ▶ Photoswitching enables resolution of emitters in time rather than space

Single molecule localization microscopy

Modeling the point spread function permits sub-pixel localization

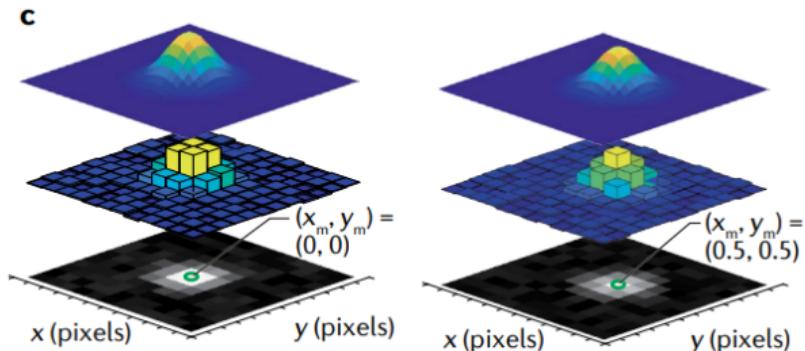

$$\mu_k = i_0 \int_{\mathbb{K}} h_\theta(x_0, y_0) dx dy$$

$$i_0 = g_k \eta N_0 \Delta$$

η – quantum efficiency

N_0 – photon count

Δ – exposure time

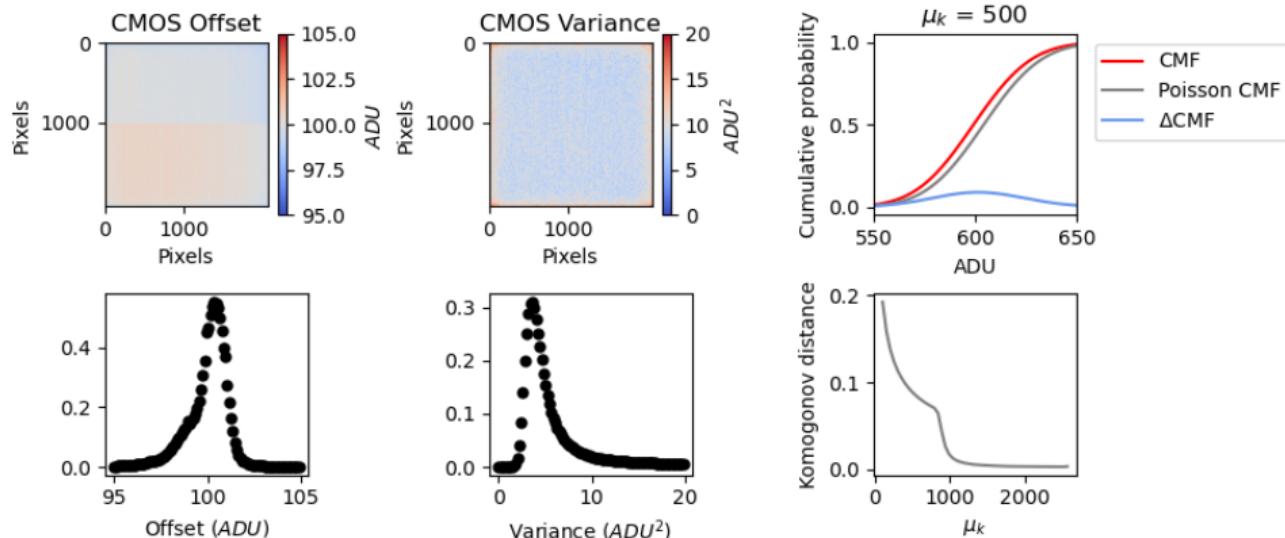

Long $\Delta \rightarrow$ pixels are iid:

$$\theta^* = \operatorname{argmax}_{\theta} \prod_k P(H_k | \theta) = \operatorname{argmin}_{\theta} - \sum_k \log P(H_k | \theta)$$

What is $P(H_k | \theta)$?

Photon statistics of fluorescent markers

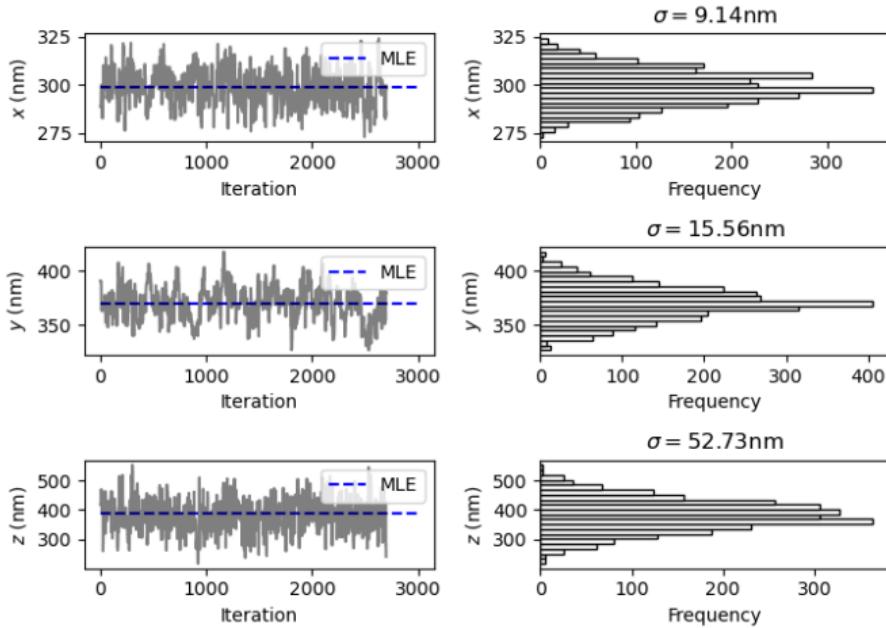

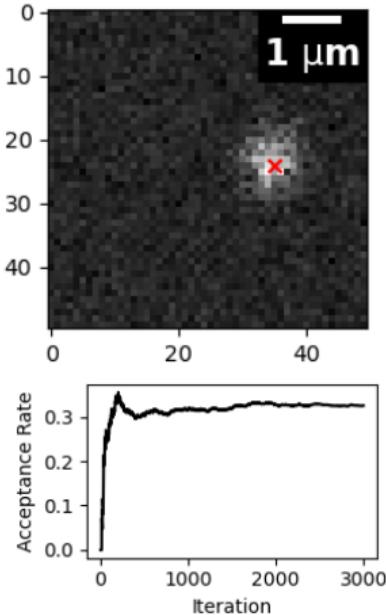

Long integration times $\Delta \rightarrow$ intensity fluctuations are Poisson

$$P(H_k|\theta) = A \sum_{q=0}^{\infty} \frac{1}{q!} e^{-\mu_k} \mu_k^q \frac{1}{\sqrt{2\pi}\sigma_k} e^{-\frac{(H_k - g_k q - \sigma_k)^2}{2\sigma_k^2}}$$

$P(H_k|\theta)$ can be approximated as Poisson at high signal-to-noise (SNR)

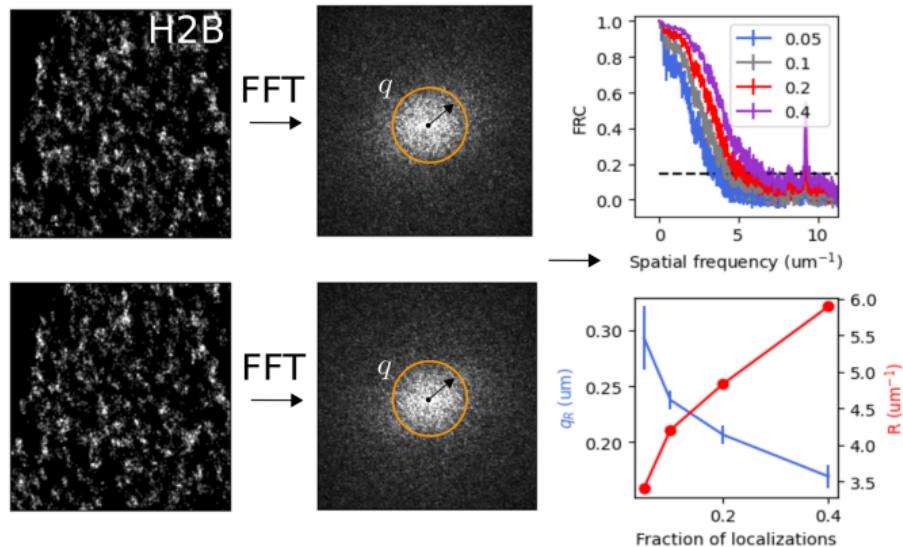

Estimator precision determines resolution in localization microscopy

- One can derive a lower bound on the variance of a statistical estimator of the coordinates θ

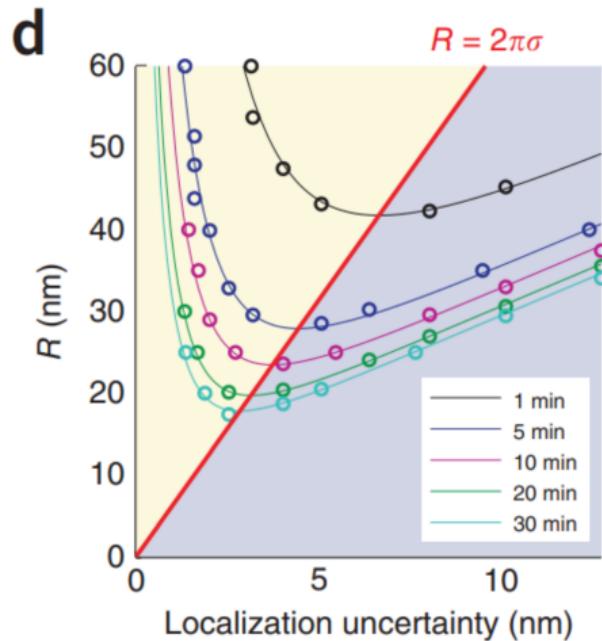

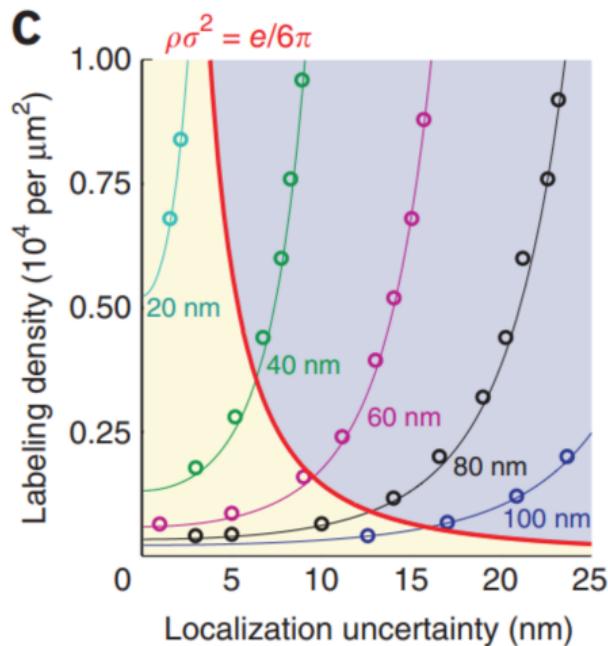

Dense localization increases time resolution

- We can view dSTORM as sampling from a density

$$\text{FRC}(q) = \frac{\sum_{\vec{q} \in \text{circle}} \tilde{f}_1(\vec{q}) \tilde{f}_2(\vec{q})^*}{\sqrt{\sum_{\vec{q} \in \text{circle}} |f_1(\vec{q})|^2} \sqrt{\sum_{\vec{q} \in \text{circle}} |f_2(\vec{q})|^2}}$$

Dense localization increases time resolution

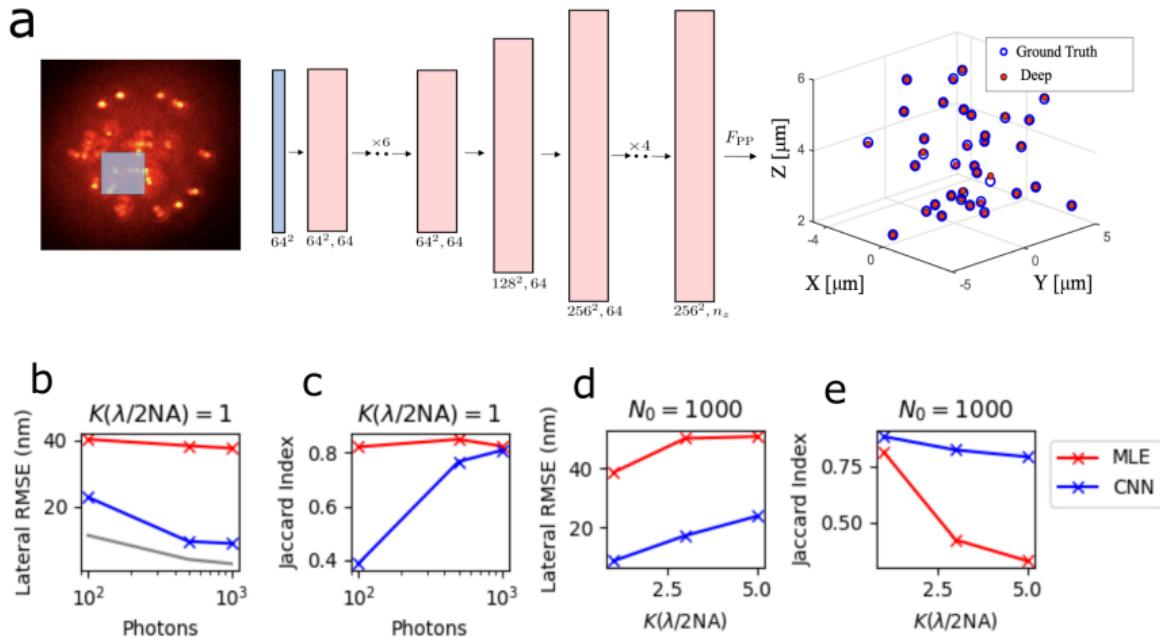

Nieuwenhuizen et al. Measuring image resolution in optical nanoscopy.

- ▶ Increased localization uncertainty requires higher density for same resolution
- ▶ Longer acquisitions have higher resolution

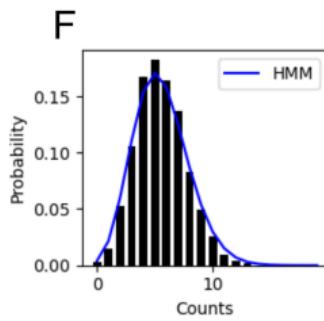

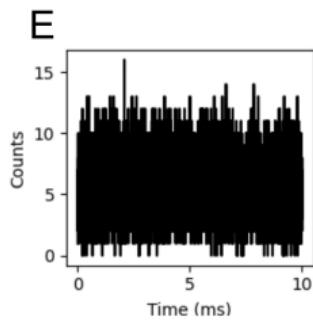

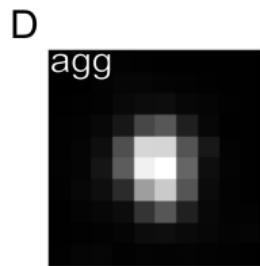

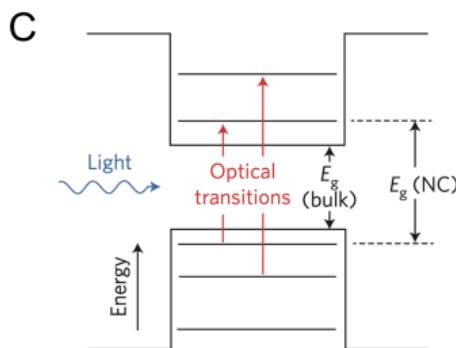

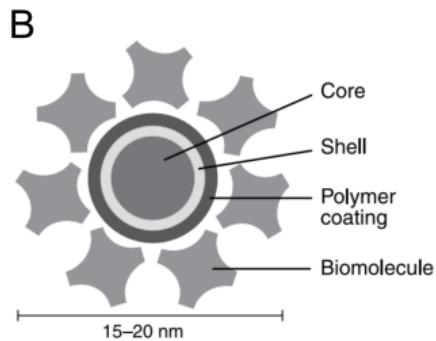

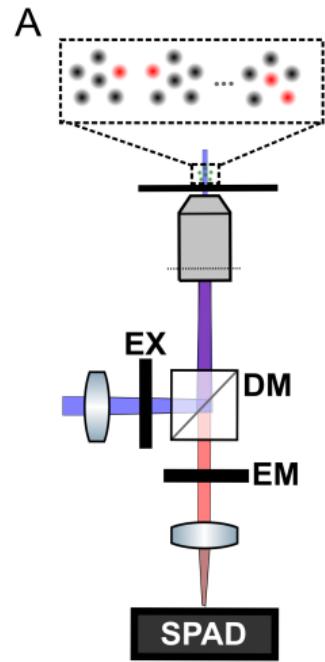

A novel approach to dense localization microscopy

DeepSTORM: An early approach to dense SMLM with deep learning

- ▶ MLE in high dimensional spaces can quickly become intractable
- ▶ We can model $P_\Psi(Z)$ with a convolutional neural network Ψ

Counting fluorescent molecules with a photon counting camera

Consider a probabilistic model with the following components:

- ▶ Continuous Coordinates: Θ
- ▶ Presence of Molecule: B (output from a neural network)
- ▶ Total Number of Molecules: M (modeled by an HMM)
- ▶ Binned Coordinates: Z

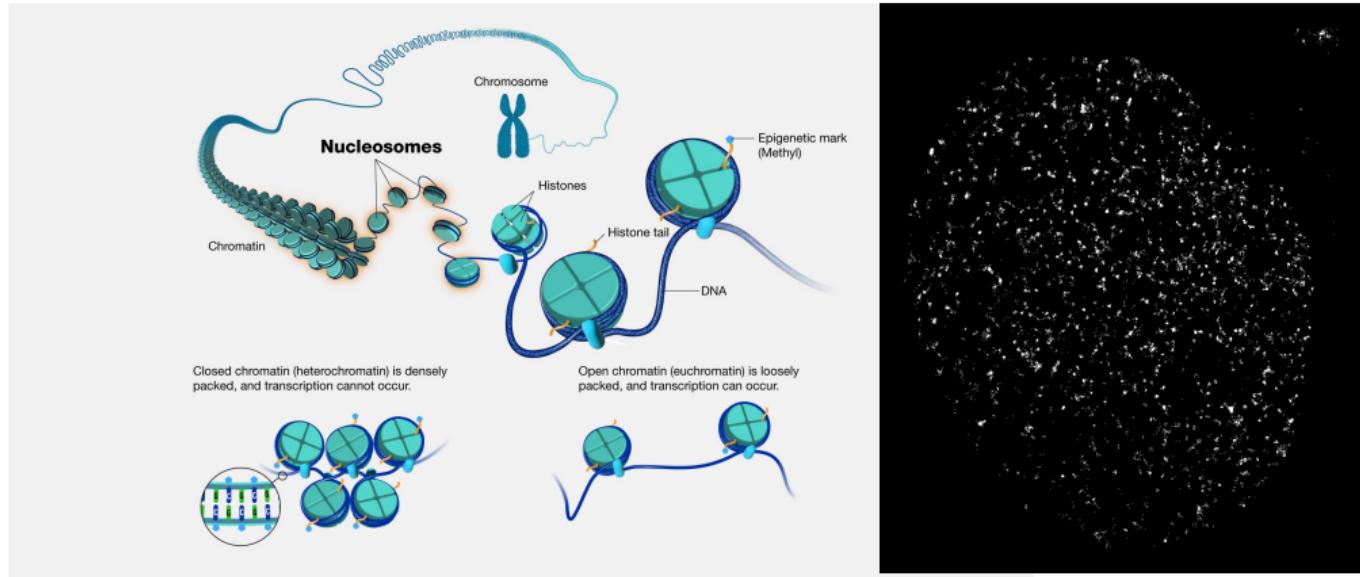

We aim to find the most probable configuration of these variables given the measured time series of photon counts X . We maximize the posterior probability $P(\theta|X)$:

$$\theta_{\text{MAP}} = \underset{\Psi, \Phi}{\operatorname{argmax}} P(\theta|Z)P(Z|B, M)P_\Psi(B|X)P_\Phi(M|X) \quad (1)$$

Optimization of $P(\theta|Z, X) = P(\theta|X)P(\theta|Z)$ can be obtained by sampling and using $P(\theta|Z)$ as a prior distribution. We can solve $\underset{Z}{\operatorname{argmax}} P(Z|B, M)$ by LoG detection on B and taking M highest peaks in B .

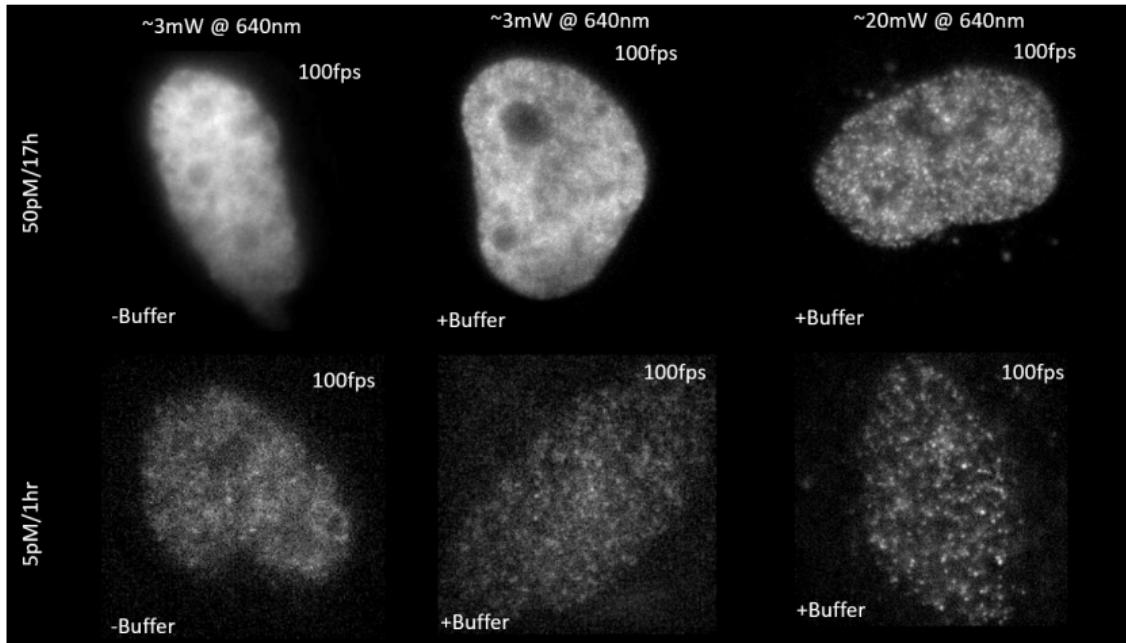

Phase separation of chromatin

Genome organization and single molecule localization microscopy

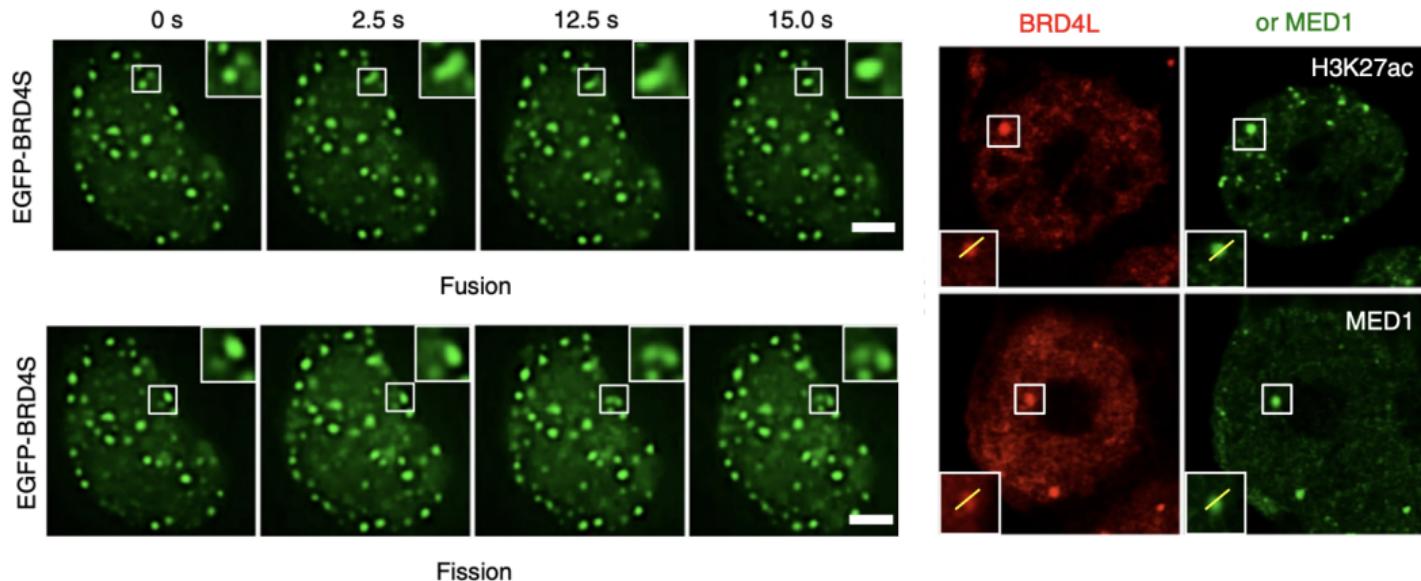

- ▶ Genome has a hierarchical structure, fundamental unit is the nucleosome
- ▶ We study chromatin organization by localizing fluorescently tagged nucleosomes

Dense labeling of histone H2B in fixed cells at RT

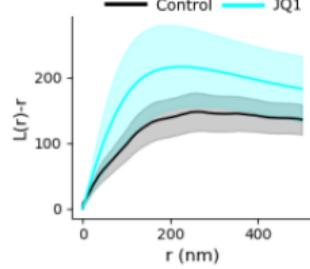

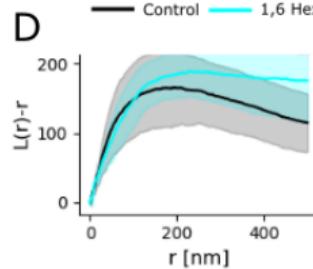

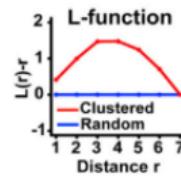

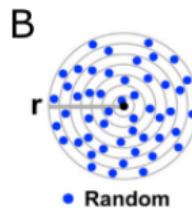

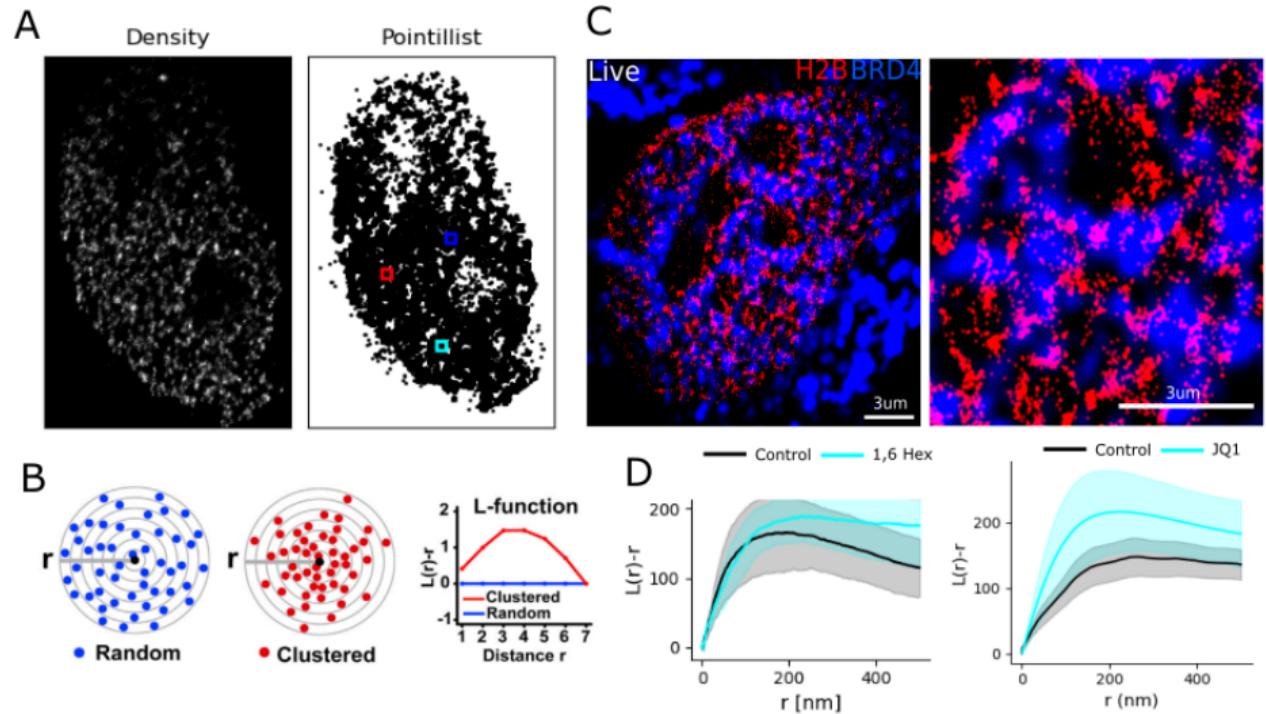

- ▶ Dense labeling of H2B-Halotag w/ fluorescent ligand JF646
- ▶ Reducing buffer is usually a primary thiol like cysteamine (MEA)
- ▶ Photoswitching of JF646 allows us to beat the diffraction limit

BRD4 condensates exhibit LLPS properties
