

Advancing super resolution microscopy for quantitative in-vivo imaging of chromatin nanodomains

Clayton W. Seitz
PhD Candidate

September 10, 2024

Outline of the talk

Introduction to fluorescence nanoscopy

Novel methods: Probabilistic modeling approaches to fluorescence nanoscopy

Approach I: Enhance nanoscopy with deep generative models

Approach II: Integrated single photon counting and widefield single molecule imaging

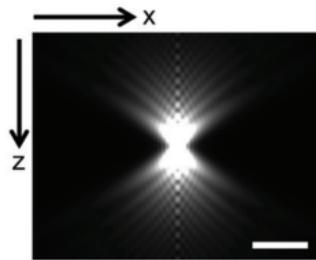

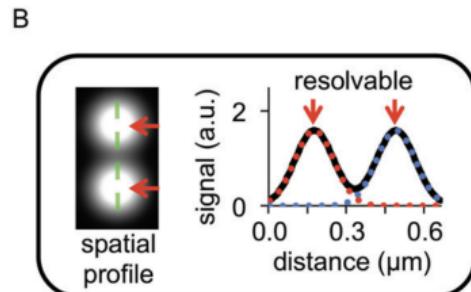

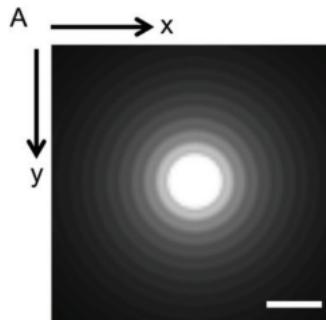

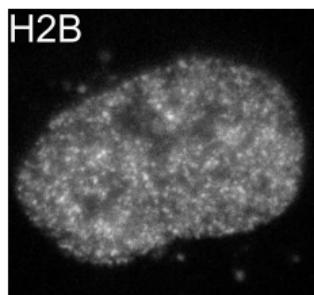

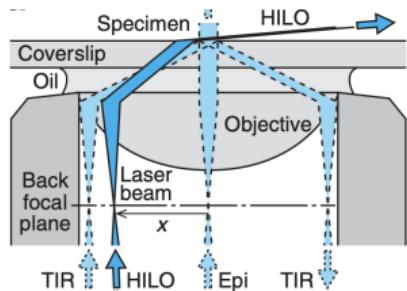

Super-resolution of nucleosome nanodomains *in-vivo*

Interaction of transcriptional condensates with nucleosome nanodomains

Introduction to fluorescence nanoscopy

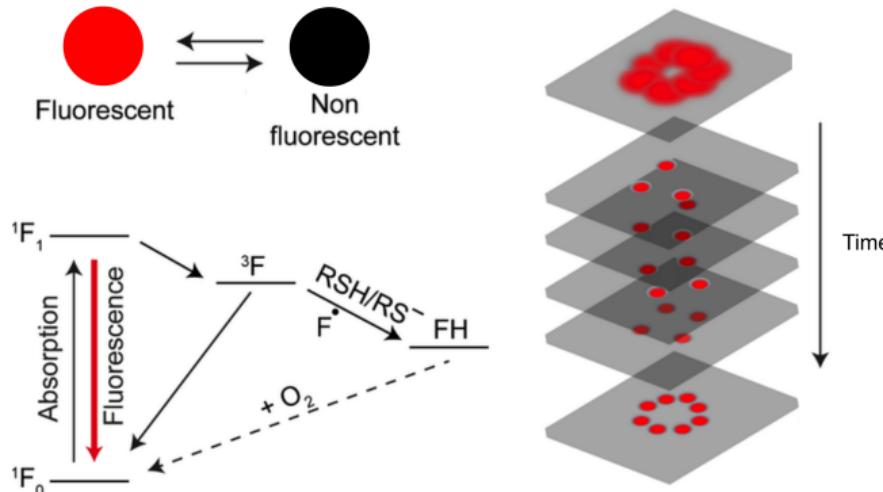

Fluorescence microscopy and the diffraction limit

- Minimal resolvable distance $d \sim \lambda/2$

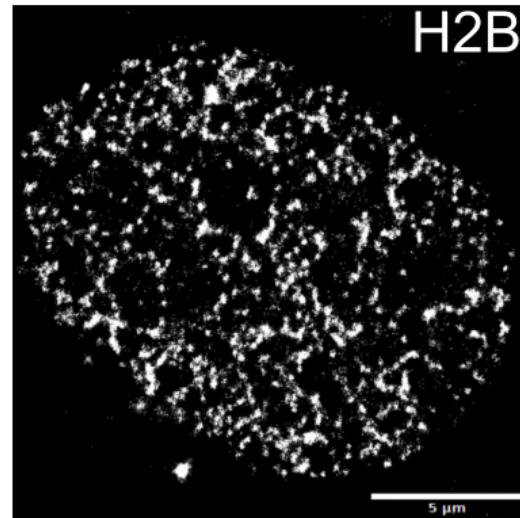

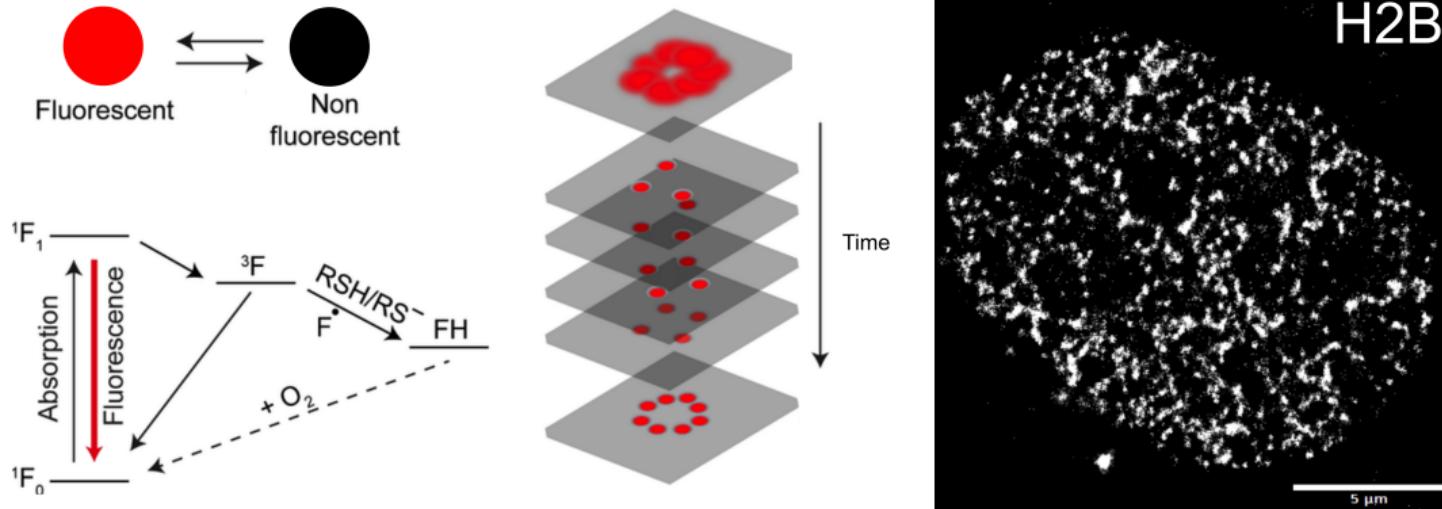

Herbert et al. Microscopy and Microanalysis.

Stochastic optical reconstruction microscopy (STORM)

- ▶ STORM and similar nanoscopy techniques are limited by localization precision
- ▶ Higher lateral/axial resolution than other methods (e.g., SIM, STED, Confocal)
- ▶ Poor time resolution

Stochastic optical reconstruction microscopy (STORM)

- ▶ STORM and similar nanoscopy techniques are limited by localization precision
- ▶ Higher lateral/axial resolution than other methods (e.g., SIM, STED, Confocal)
- ▶ Poor time resolution

Nanoscopy by localizing isolated fluorescent emitters

- Modeling the point spread function permits sub-pixel localization

$$\mu_k = i_0 \int \int O(u, v) du dv + \lambda$$

$$i_0 = g_k \eta \zeta \Delta$$

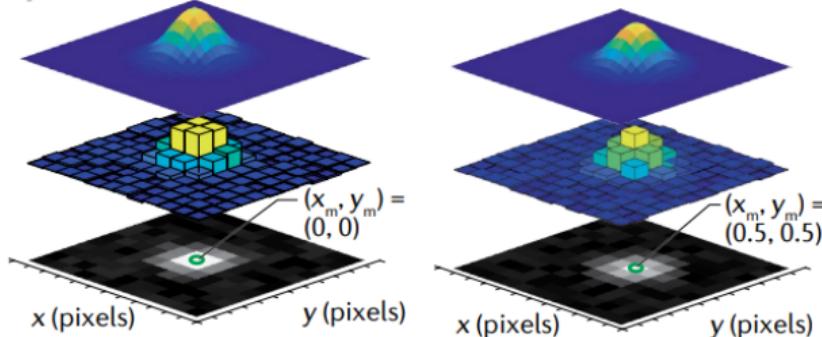

g_k – pixel gain

η – quantum efficiency

ζ – photon emission rate

Δ – exposure time

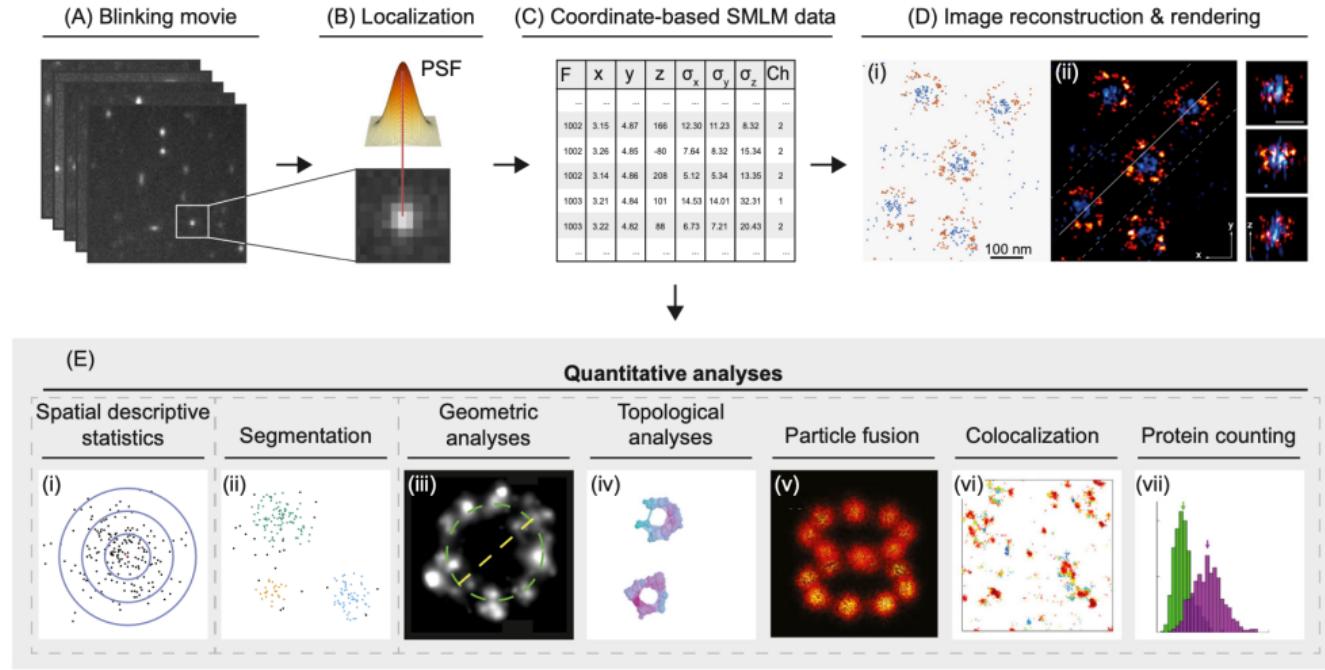

λ – background rate

Maximum likelihood localization:

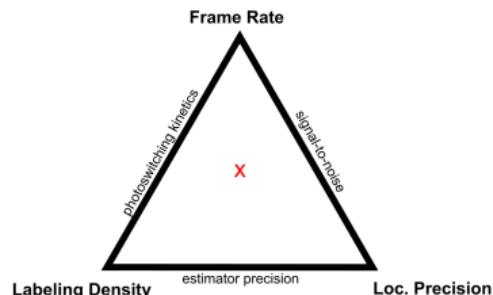

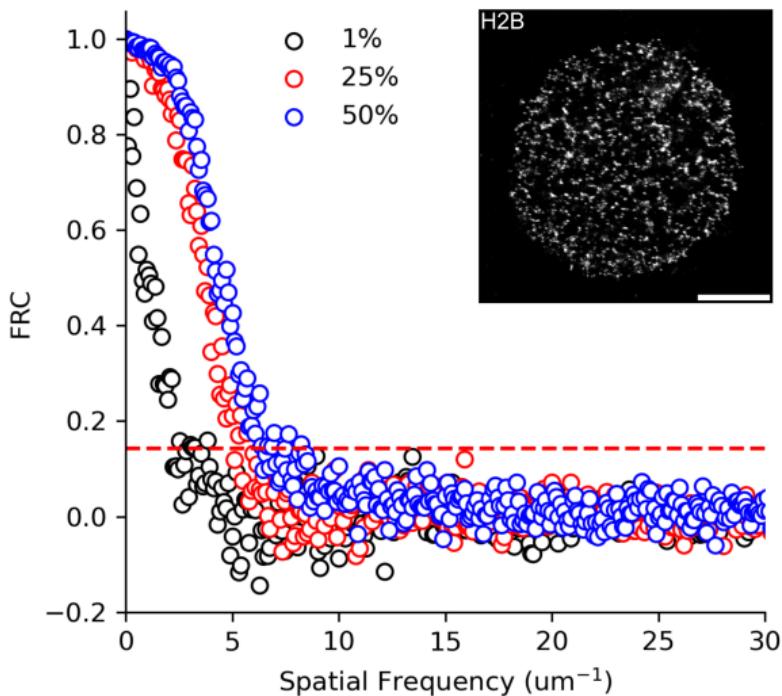

$$\theta^* = \operatorname{argmax}_{\theta} \prod_k p(\mathbf{x}_k | \theta) = \operatorname{argmin}_{\theta} - \sum_k \log p(\mathbf{x}_k | \theta)$$

Applications of single molecule localization microscopy

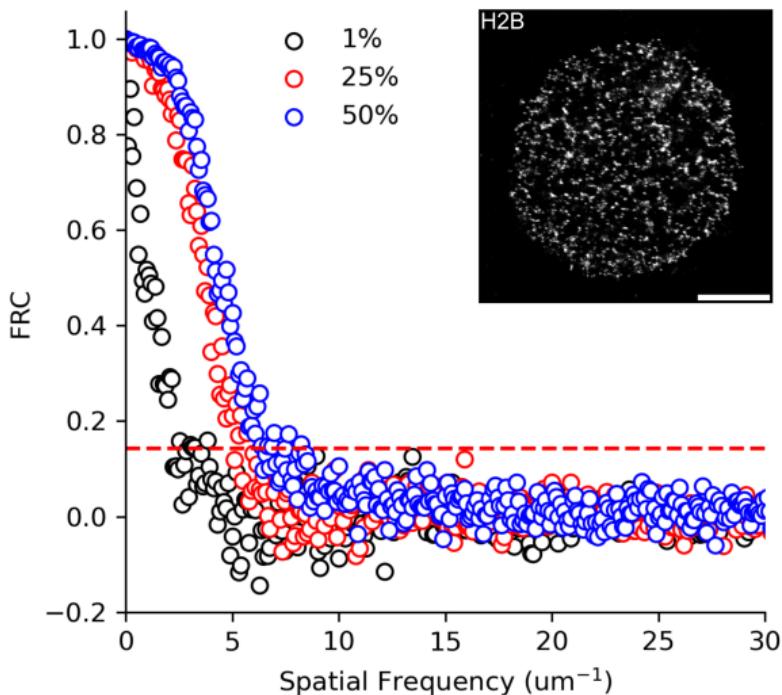

Wu et al. Trends in Cell Biology. 30 (2020)

Maximization of density, minimization of error

- ▶ Maximize density and in turn spatial/temporal resolution
- ▶ Minimize localization errors

Maximization of density, minimization of error

- ▶ Maximize density and in turn spatial/temporal resolution
- ▶ Minimize localization errors

Novel methods: Probabilistic modeling approaches to fluorescence nanoscopy

The Bayesian calculation and variational inference

Bayes Rule: $p(\theta|x) = \frac{p(x|\theta)p(\theta)}{\int p(x,\theta)d\theta} \propto p(x|\theta)p(\theta)$

- ▶ The posterior $p(\theta|x)$ is can be hard to obtain
- ▶ We can instead try to sample from $p(\theta|x)$
- ▶ Can naturally represent uncertainty during inference

Approach I: Resolution enhancement with a diffusion model

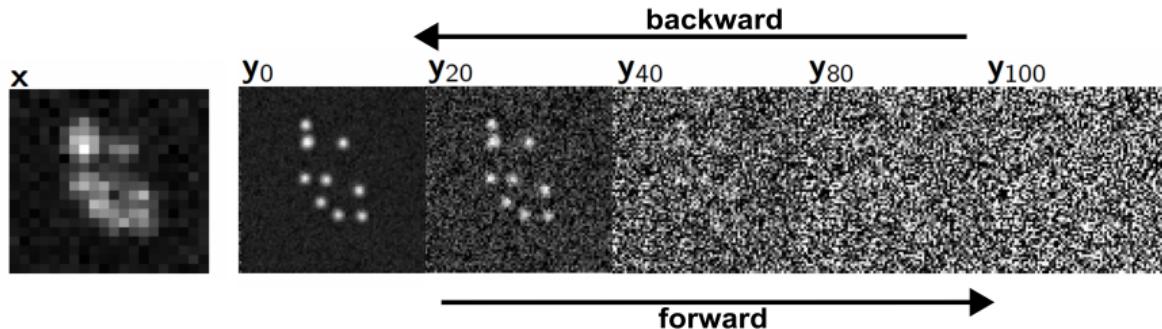

- ▶ Can sample from $p(\theta|x)$ using a stochastic process called Langevin dynamics

Drift and diffusion: $\theta_t = \overbrace{\theta_{t-1} - \frac{\beta}{2} \nabla f(\theta)}^{\mu} + \sqrt{\beta} \xi \quad \xi \sim \mathcal{N}(0, I)$

Approach I: Resolution enhancement with a diffusion model

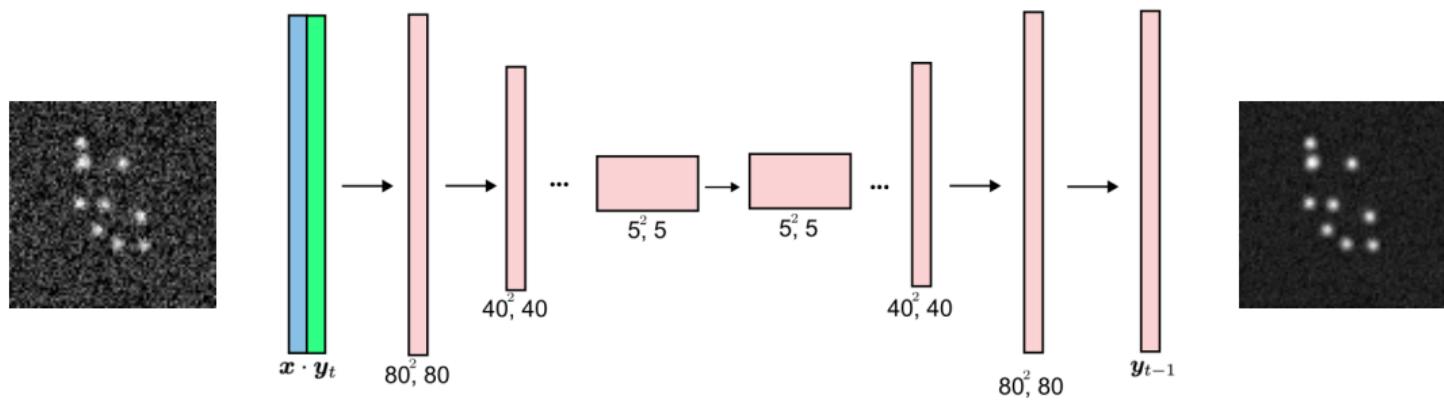

- ▶ Task: infer a high resolution image \mathbf{y}_0 from low resolution \mathbf{x}
- ▶ Drift is not available for image data, but can be learned from pairs $(\mathbf{x}, \mathbf{y}_0)$

$$p_{\psi}(\mathbf{y}_{t-1} | \mathbf{y}_t, \mathbf{x}) = \mathcal{N}(\mu_{\psi}, \beta_t I)$$

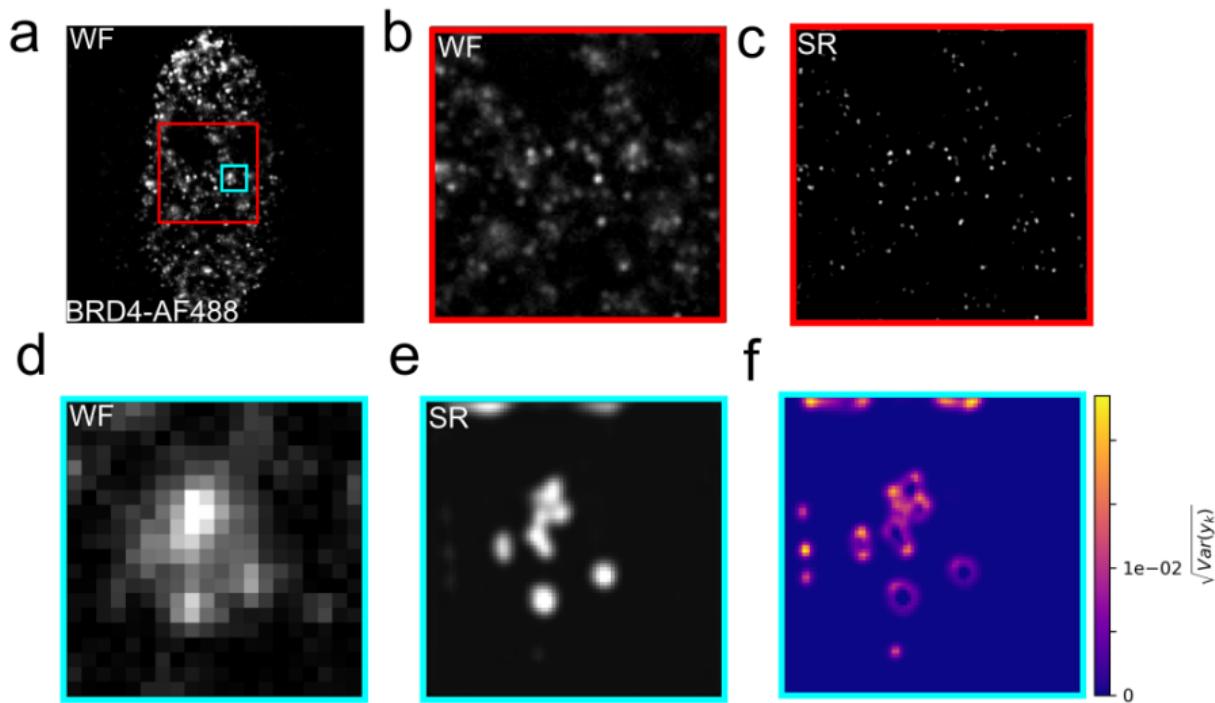

$$q(\mathbf{y}_t | \mathbf{y}_{t-1}) = \mathcal{N}\left(\sqrt{1 - \beta_t} \mathbf{y}_{t-1}, \beta_t I\right)$$

Approach I: Resolution enhancement with a diffusion model

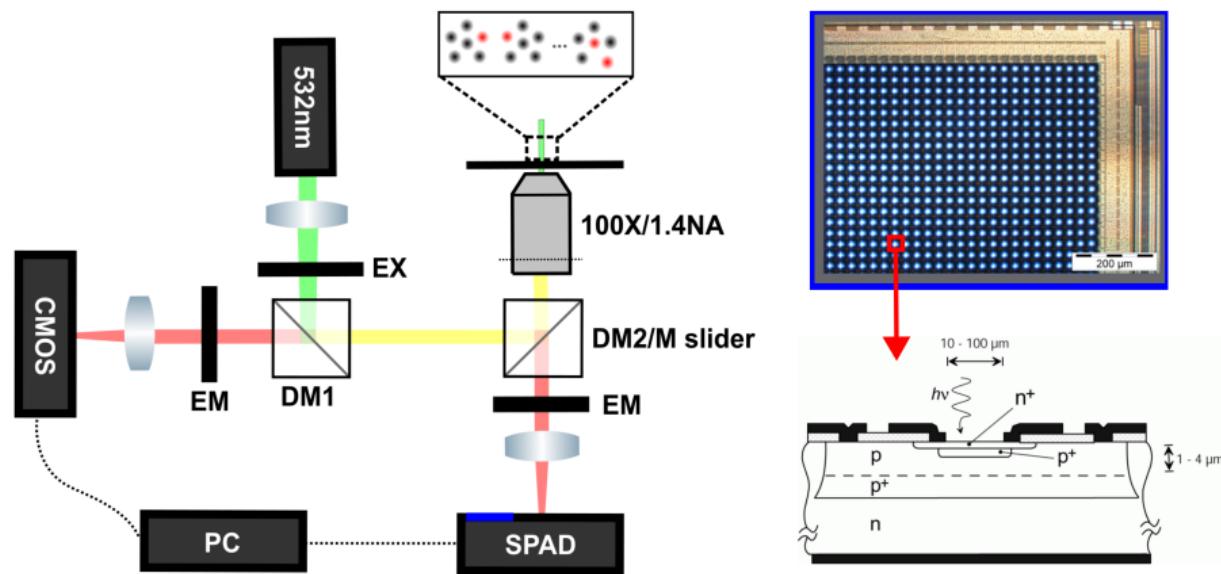

- ▶ A convolutional neural network ψ estimates the drift μ_ψ
- ▶ Denoising step: $\mathbf{y}_{t-1} \sim p_\psi(\mathbf{y}_{t-1} | \mathbf{y}_t, \mathbf{x}) = \mathcal{N}(\mu_\psi, \beta_t I)$

Super resolution of BRD4 protein in a HeLa cell

Approach II: Integrated single photon counting and widefield single molecule imaging

- ▶ Single photon avalanche diode (SPAD) arrays give us new modeling approaches

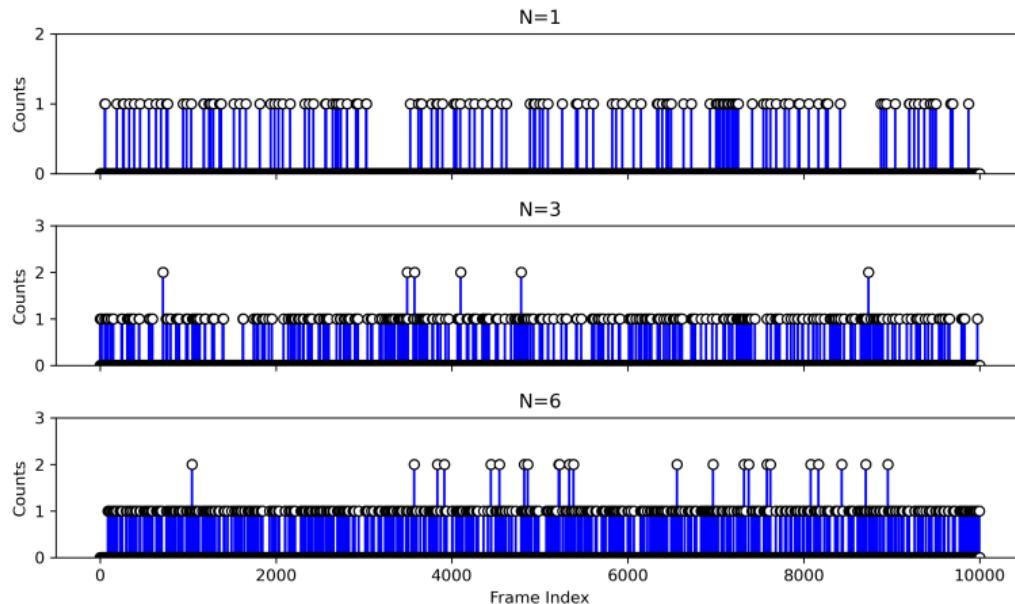

Imaging Qdot655 photon by photon

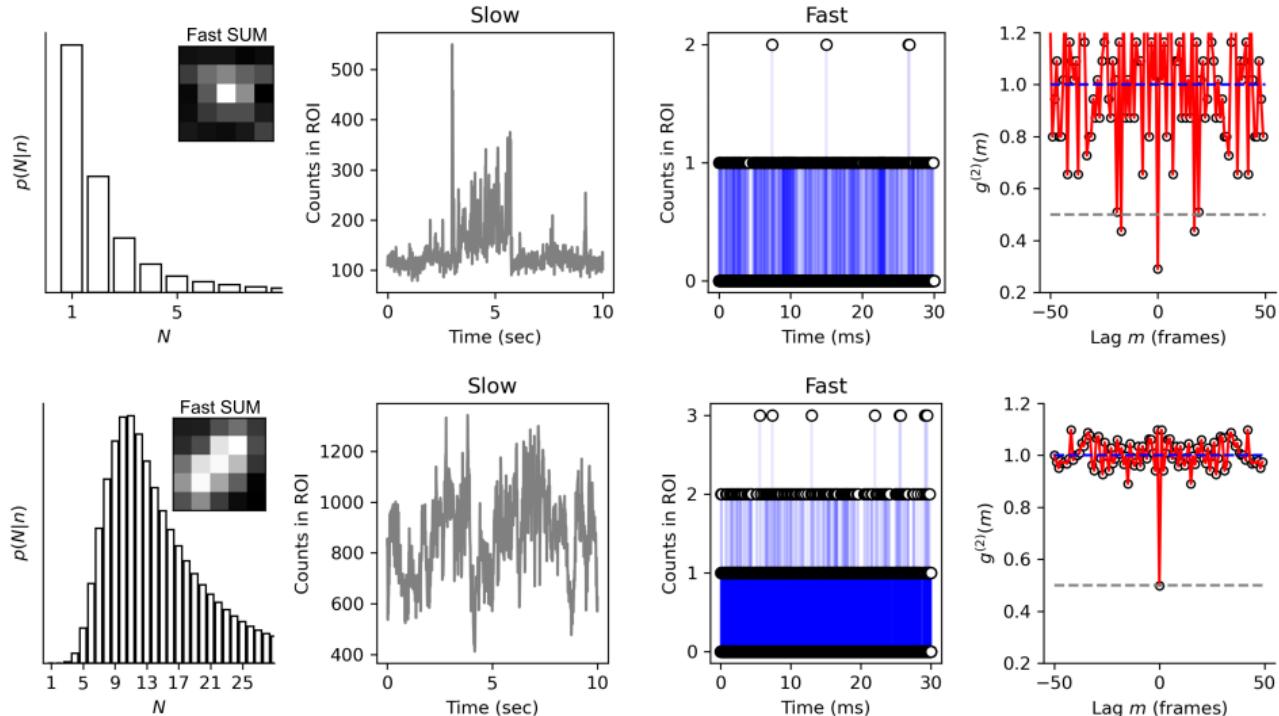

- Zero-lag second order coherence: $g^{(2)}(0) = G^{(2)}(0)/\langle G^{(2)}(m) \rangle$

Poisson-Binomial photon count data (simulation)

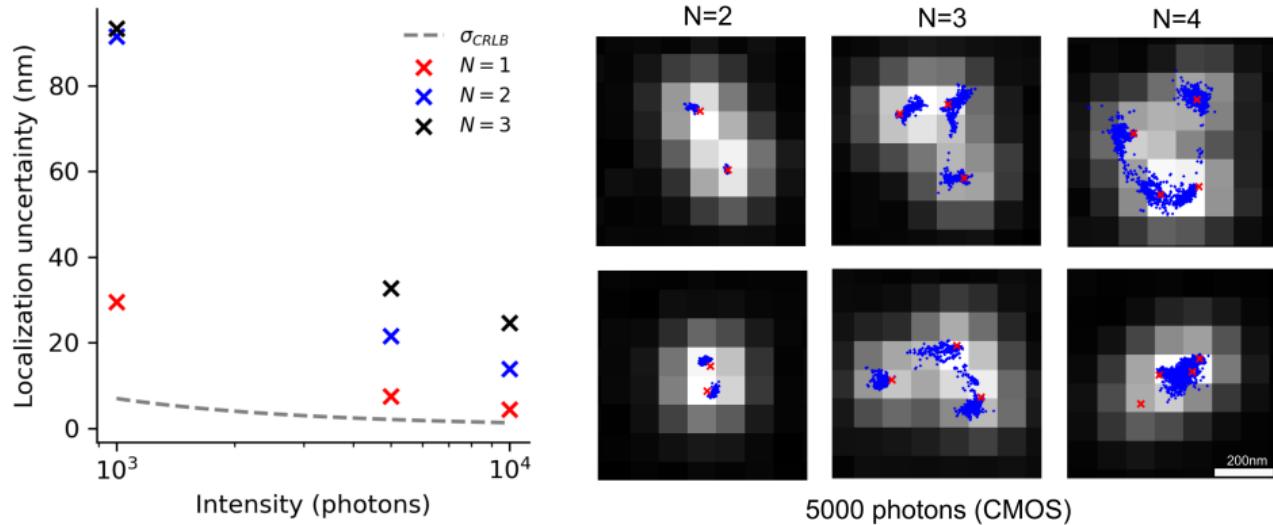

- ▶ SPAD arrays permit modeling of time-series of photon counts n_t
- ▶ Likelihood on counts: $\mathcal{L}(n_t|N, \zeta, \lambda) = \text{Poisson}(\lambda) * \text{Binomial}(N, \zeta)$

Discrimination of single and multiple quantum dots

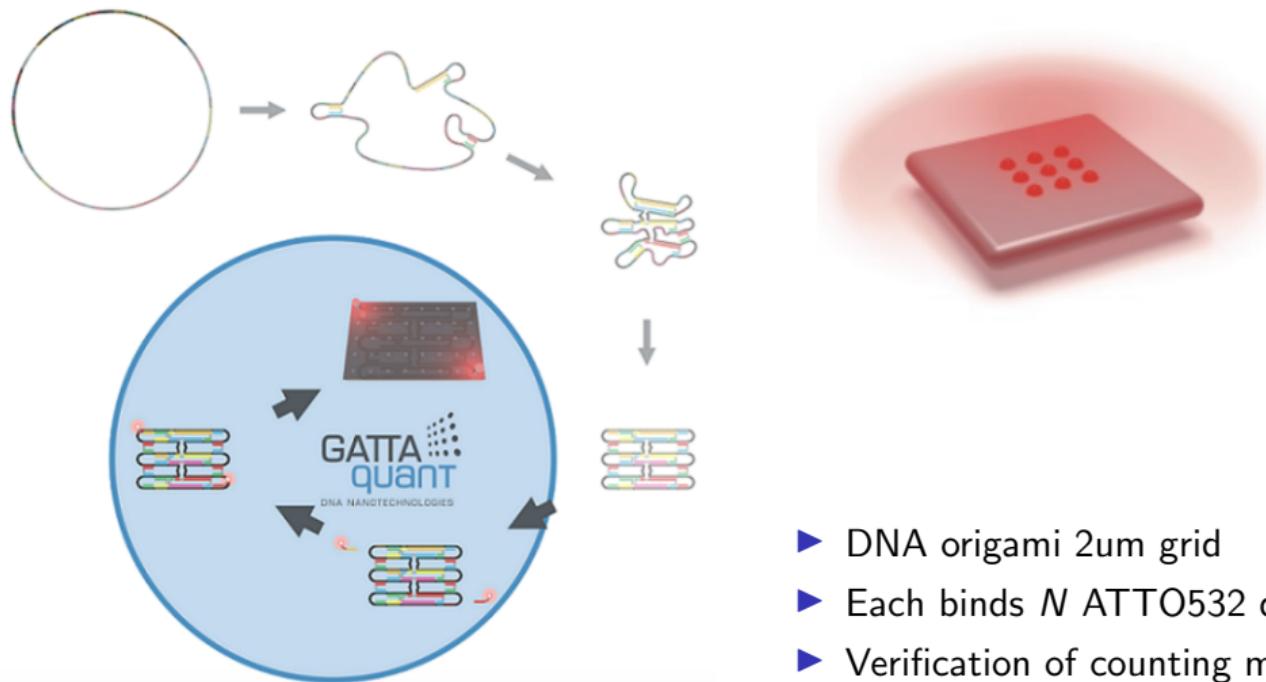

Blinking in quantum dots occurs due to non-radiative relaxation pathways

Constrained multi-emitter localization (simulation)

- ▶ Constrained multi-emitter localization when N is known
- ▶ Multiple emitters can be fit simultaneously using MCMC sampling

Upcoming work: counting ATTO532 dye bound to DNA origamis

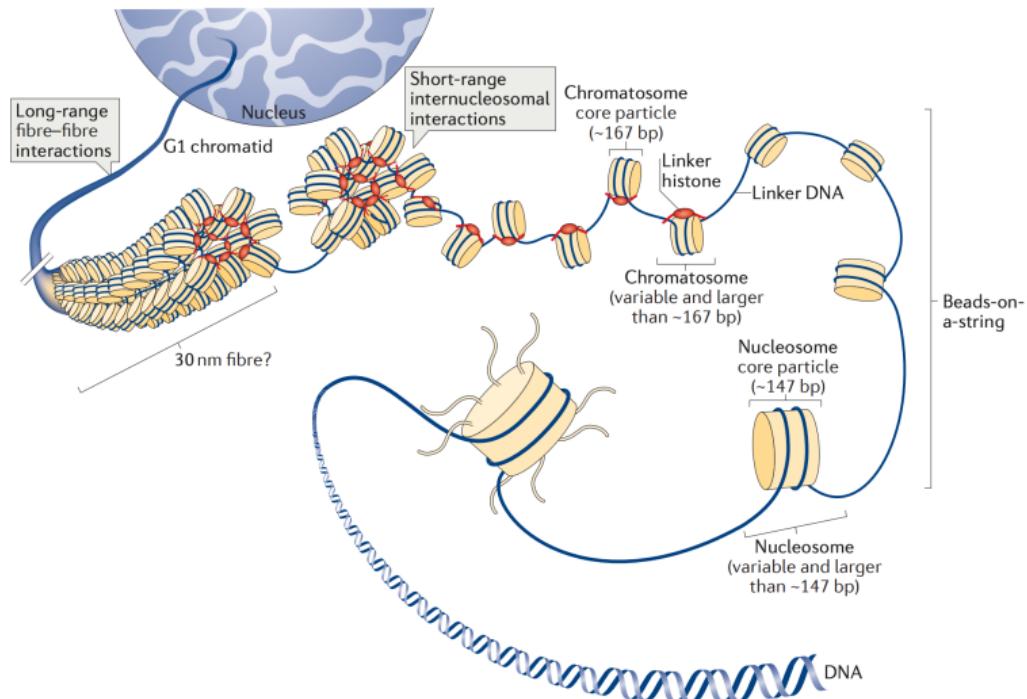

- ▶ DNA origami 2um grid
- ▶ Each binds N ATTO532 dyes
- ▶ Verification of counting method

Super-resolution of nucleosome nanodomains *in-vivo*

Hierarchical structure of chromatin

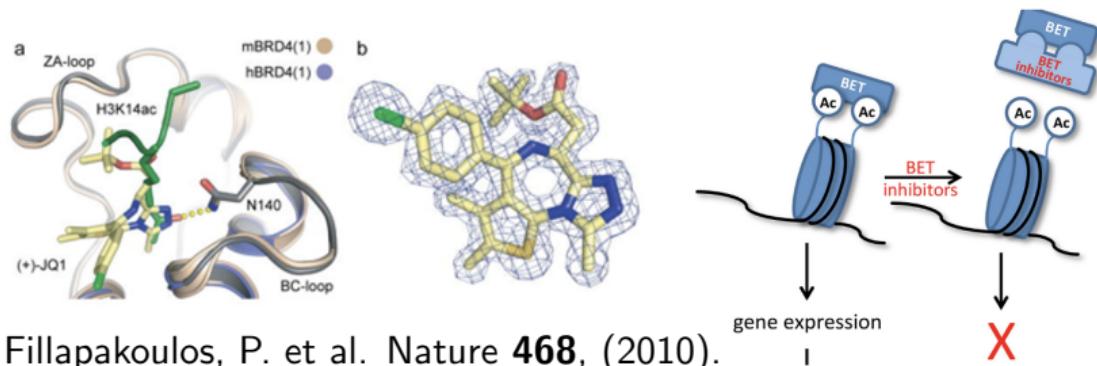

Fyodorov, D. et al. Nat Rev Mol Cell Biol **19**, (2018).

Bromodomain protein 4 (BRD4) binds acetylated chromatin

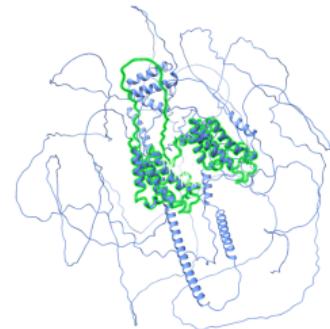

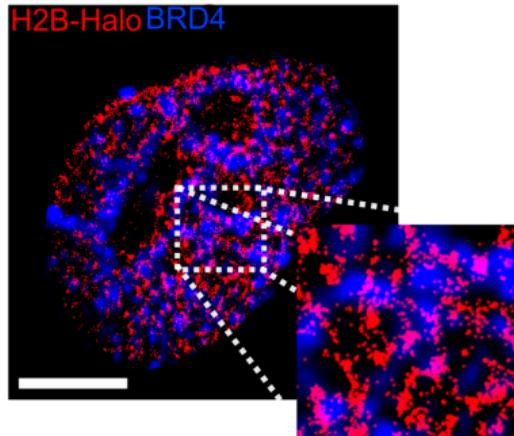

Zheng, B. et al. Molecular Cell **16**, (2023).

Fillapakoulos, P. et al. Nature **468**, (2010).

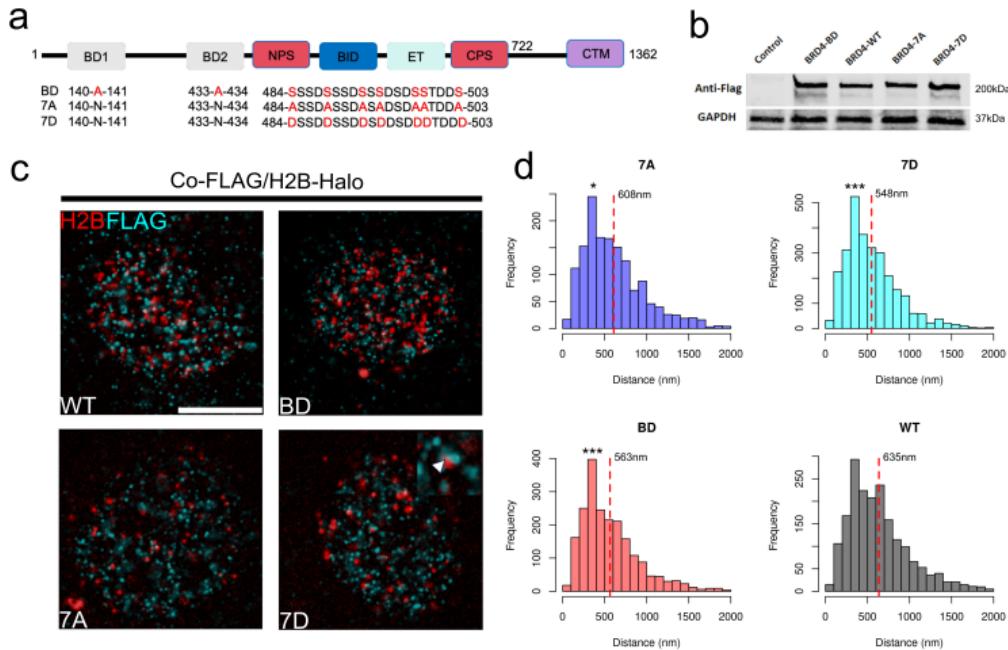

BRD4 mutations to probe effects on chromatin structure

AlphaFold BRD4 1-1362aa

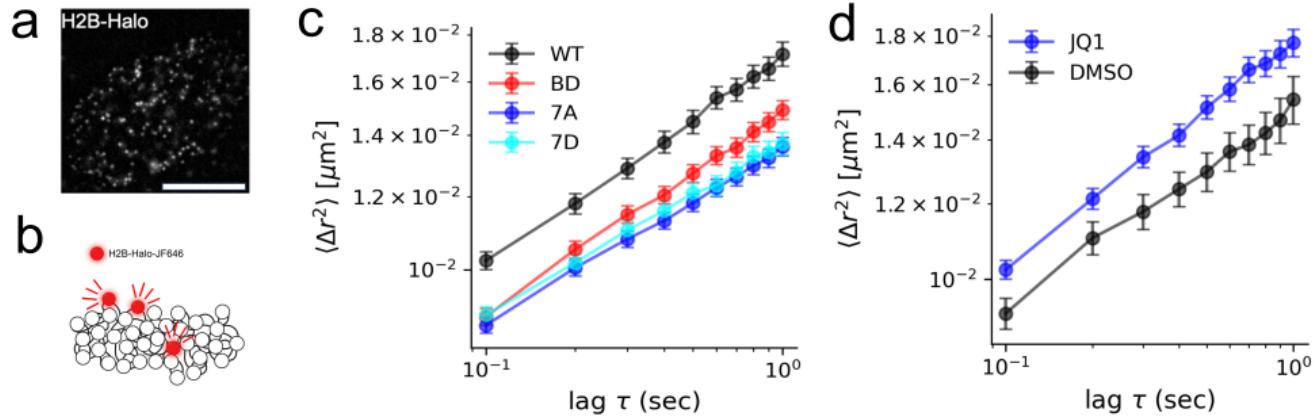

- ▶ 7A mutant - Constitutively unphosphorylated
- ▶ 7D mutant - Constitutively phosphorylated
- ▶ BD mutant - Bromodomain deactivated

BRD4 recruitment to nucleosome nanodomains

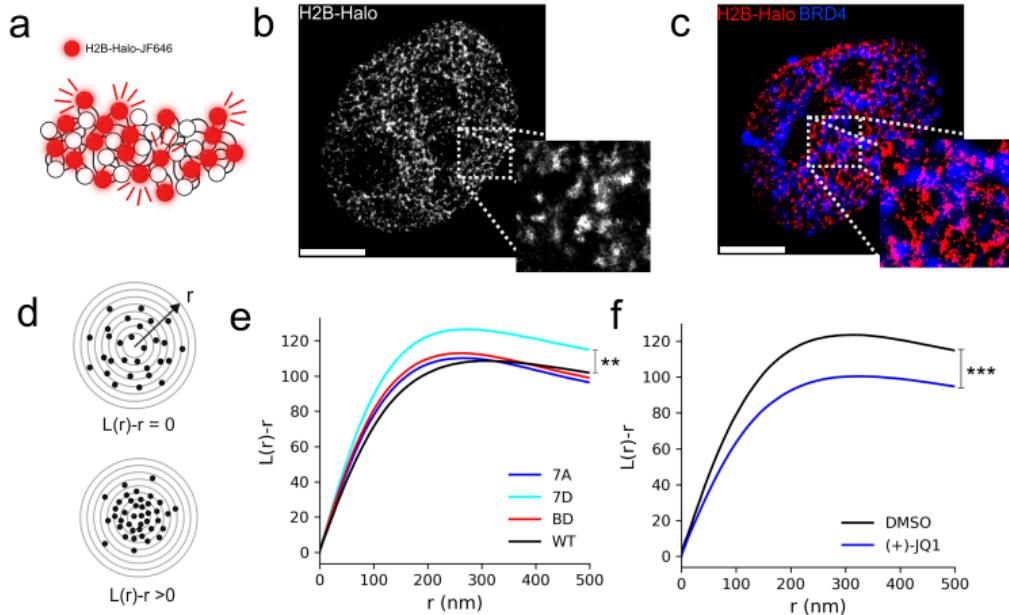

- ▶ Phosphorylation enhances BRD4 binding to acetylated chromatin
- ▶ Hyperphosphorylation - resistance mechanism to BD loss (Shu 2016)

BRD4 chromatin binding controls chromatin mobility

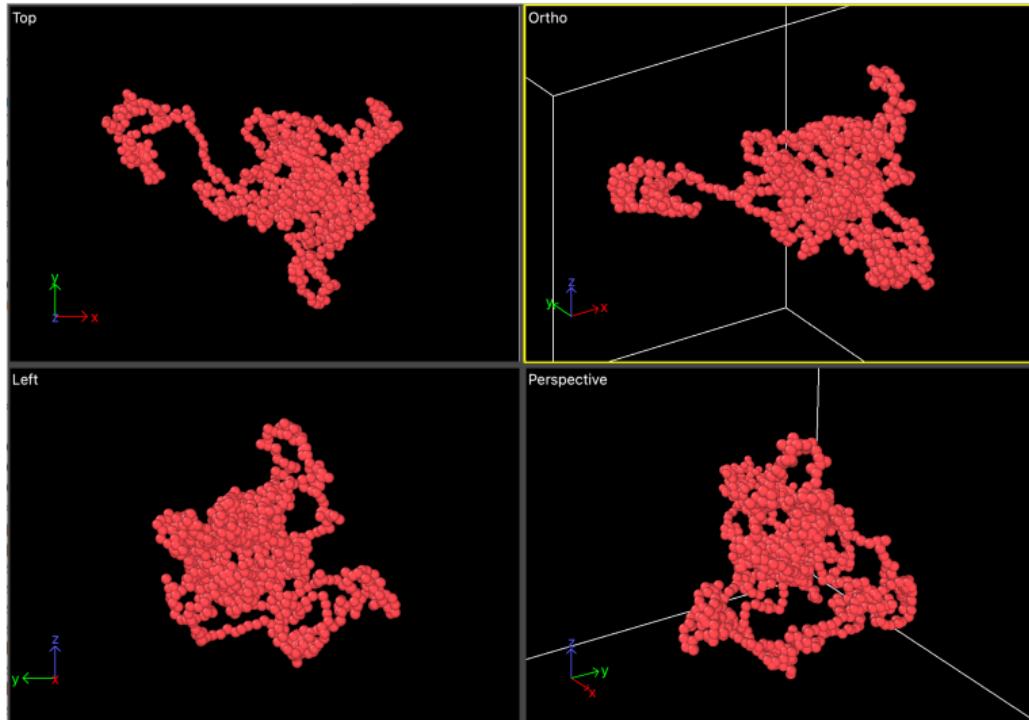

- ▶ H2B is sparsely labeled for particle tracking
- ▶ Reduced diffusion coefficient D in BRD4 mutants
- ▶ Increased D in cells exposed to (+)-JQ1

BRD4 binding is necessary for maintenance of nucleosome nanodomains

- ▶ H2B is densely labeled for super-resolution imaging
- ▶ BRD4 chromatin binding activity controls nanodomain density

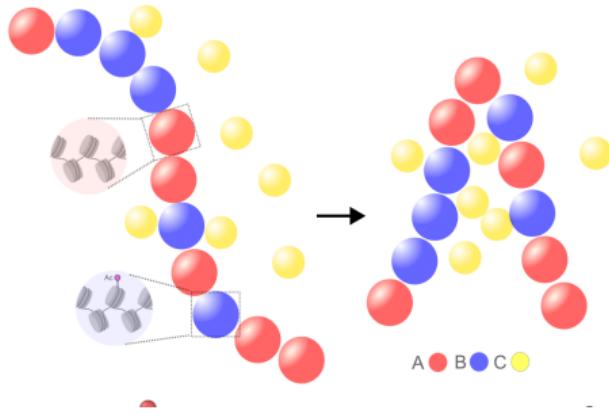

Coarse grained molecular dynamics of chromatin at 310K

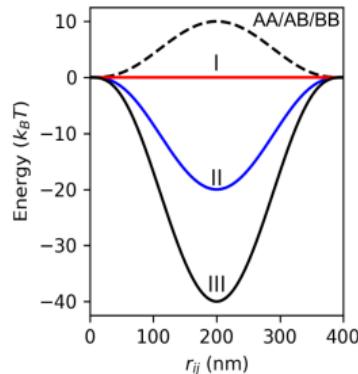

- ▶ 100kb chromatin beads connected by harmonic bonds (Rouse model)

Coarse grained molecular dynamics of chromatin binders at 310K

a

b

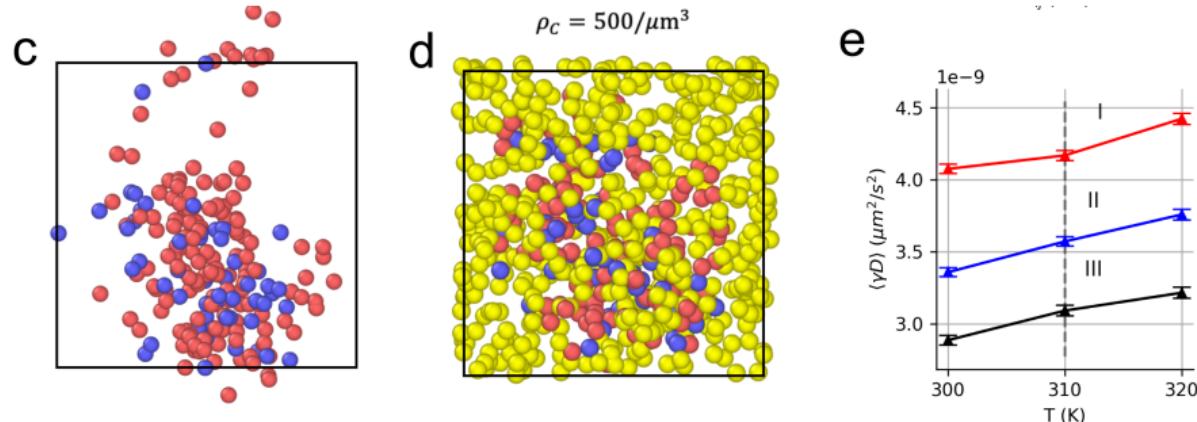

Chromatin chains interact with binders via the potential

$$U_{ij} = \epsilon \left(1 - \left(\frac{|r_{ij}|}{R_0} \right)^2 \right)^3$$

- ▶ A (B) type particles represent unacetylated (acetylated) chromatin beads
- ▶ BRD4-like C particles bind B type particles with variable energies

Multivalent chromatin binding reduces chromatin mobility

Integrate Brownian dynamics: $\dot{r} = \gamma^{-1} \nabla U + \sqrt{2k_B T} \gamma^{-1/2} \xi$ $\gamma = 10^{-6}$

Stochastic forcing is a delta-correlated noise $\xi \sim \mathcal{N}(0, 1)$, $\langle \xi(t) \xi(t + \tau) \rangle = \delta(\tau)$

Summary of contributions

- ▶ First generative model of super-resolution microscopy images from low-resolution inputs
- ▶ Applied SPAD array for counting fluorescent molecules in widefield microscopy
- ▶ First data supporting control of chromatin architecture by transcriptional condensates
